 A Thickness, T , shall be 3.2± 0.4 mm (0.13 ± 0.02 in.) for all types of molded specimens, and for other Types I and II specimens where possible. If specimens are machined from sheets or plates, thickness, T , shall be the thickness of the sheet or plate provided this does not exceed the range stated for the intended specimen type. For sheets of nominal thickness greater than 14 mm (0.55 in.) the specimens shall be machined to 14 ± 0.4 mm (0.55 ± 0.02 in.) in thickness, for use with the Type III specimen. For sheets of nominal thickness between 14 and 51 mm (0.55 and 2 in.) approximately equal amounts shall be machined from each surface. For thicker sheets both surfaces of the specimen shall be machined, and the location of the specimen with reference to the original thickness of the sheet shall be noted. Tolerances on thickness less than 14 mm (0.55 in.) shall be those standard for the grade of material tested.

^BFor the Type IV specimen, the internal width of the narrow section of the die shall be 6.00 ± 0.05 mm (0.250 ± 0.002 in.). The dimensions are essentially those of Die C in Test Methods D412.

CThe Type V specimen shall be machined or die cut to the dimensions shown, or molded in a mold whose cavity has these dimensions. The dimensions shall be:

 $W = 3.18 \pm 0.03$ mm (0.125 \pm 0.001 in.),

 $L = 9.53 \pm 0.08$ mm (0.375 ± 0.003 in.), $G = 7.62 \pm 0.02$ mm (0.300 ± 0.001 in.), and

 $G = 7.62 \pm 0.02 \text{ mm } (0.300 \pm 0.001 \text{ in.}), \text{ ar}$

 $R = 12.7 \pm 0.08$ mm (0.500 \pm 0.003 in.). The other tolerances are those in the table.

^DSupporting data on the introduction of the L specimen of Test Method D1822 as the Type V specimen are available from ASTM Headquarters. Request RR:D20-1038. EThe tolerances of the width at the center W_c shall be +0.00 mm, -0.10 mm (+0.000 in., -0.004 in.) compared with width W at other parts of the reduced section. Any reduction in W at the center shall be gradual, equally on each side so that no abrupt changes in dimension result.

For molded specimens, a draft of not over 0.13 mm (0.005 in.) is allowed for either Type I or II specimens 3.2 mm (0.13 in.) in thickness. See diagram below and this shall be taken into account when calculating width of the specimen. Thus a typical section of a molded Type I specimen, having the maximum allowable draft, could be as follows:

^GOverall widths greater than the minimum indicated are used for some materials in order to avoid breaking in the grips.

HOverall lengths greater than the minimum indicated are used for some materials to avoid breaking in the grips or to satisfy special test requirements.

'Test marks or initial extensometer span.

'When self-tightening grips are used, for highly extensible polymers, the distance between grips will depend upon the types of grips used and may not be critical if maintained uniform once chosen.

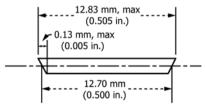

FIG. 1 Tension Test Specimens for Sheet, Plate, and Molded Plastics
